## 1. SW Dev Environment

Google keywords	Description & URLs	tested versions
Cygwin	GNU file utils and make for Windows <a href="https://www.cygwin.com/">https://www.cygwin.com/</a>	> make --version GNU Make 4.1
TortoiseGit	Windows based GIT: <a href="https://tortoisegit.org/">https://tortoisegit.org/</a> <a href="https://git-for-windows.github.io/">https://git-for-windows.github.io/</a>	> git --version git version 2.6.2.windows.1
WinAvr	Windows GCC Compiler, Linker and C libraries <a href="http://sourceforge.net/projects/winavr/">http://sourceforge.net/projects/winavr/</a>	> avr-gcc --version avr-gcc.exe (winAVR 20100110) 4.3.3
Atmel Studio	IProgrammer Software which uses the JTAGICE3 debug pod <a href="http://www.atmel.com/tools/atmelstudio.aspx">http://www.atmel.com/tools/atmelstudio.aspx</a>	version 7

## 2. HW tools

### 2.1. Atmel JTAGICE3

Google	"Atmel JTAGICE3"
Source	Digikey: <a href="http://www.digikey.com/product-detail/en/ATJTAGICE3/ATJTAGICE3-ND/">http://www.digikey.com/product-detail/en/ATJTAGICE3/ATJTAGICE3-ND/</a>
Support pages	<a href="http://www.atmel.com/tools/JTAGICE3.aspx">http://www.atmel.com/tools/JTAGICE3.aspx</a> <a href="http://www.atmel.com/webdoc/jtagice3/">http://www.atmel.com/webdoc/jtagice3/</a>

### 3. Hello Uno

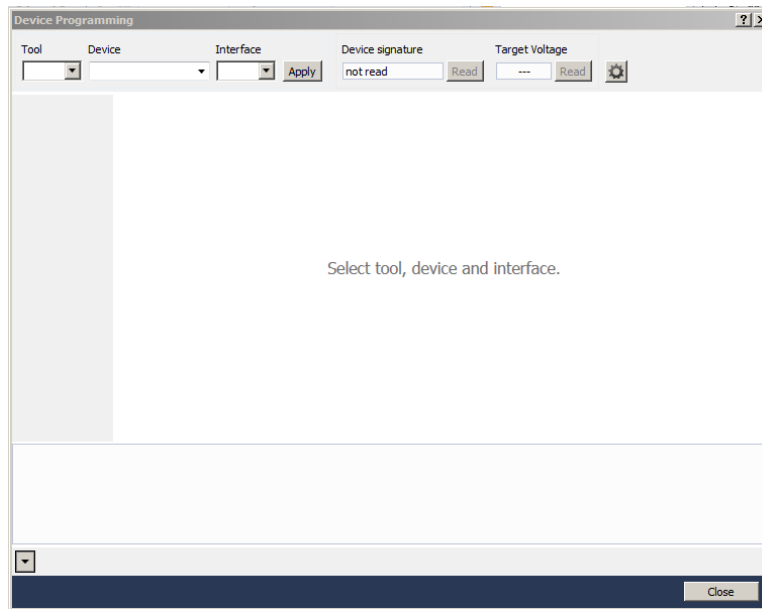

#### 3.1. Build

```
> git clone <github repo>
> cd hello_arduino/uno
> make
...
Linking: hello_uno.elf
...
Creating load file for Flash: hello_uno.hex
...
> ls hello_uno.hex
hello_uno.hex
```

### 3.2. Connect ISP pod to Atmel Studio and Uno

#### Connect to ISP pod

within Atmel studio, select: Tools→ Device Programming

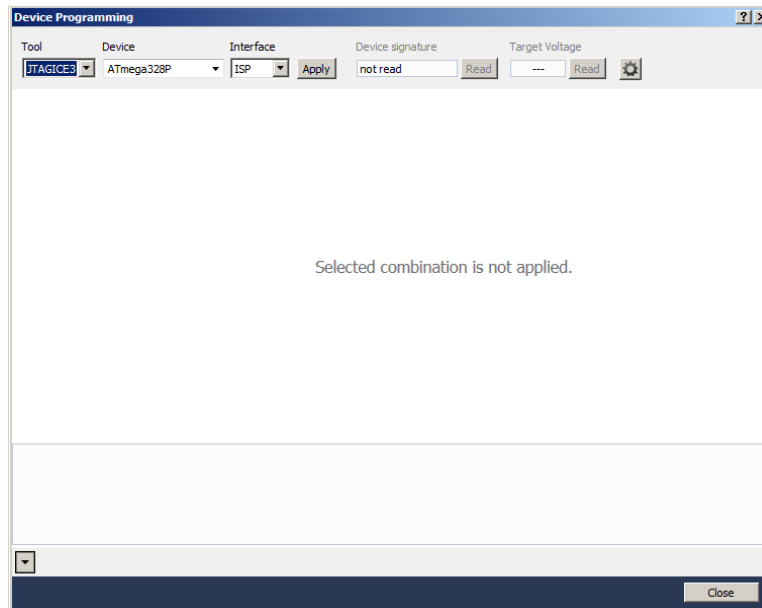

Connect the JTAGICE3 pod to a windows PC USB port.

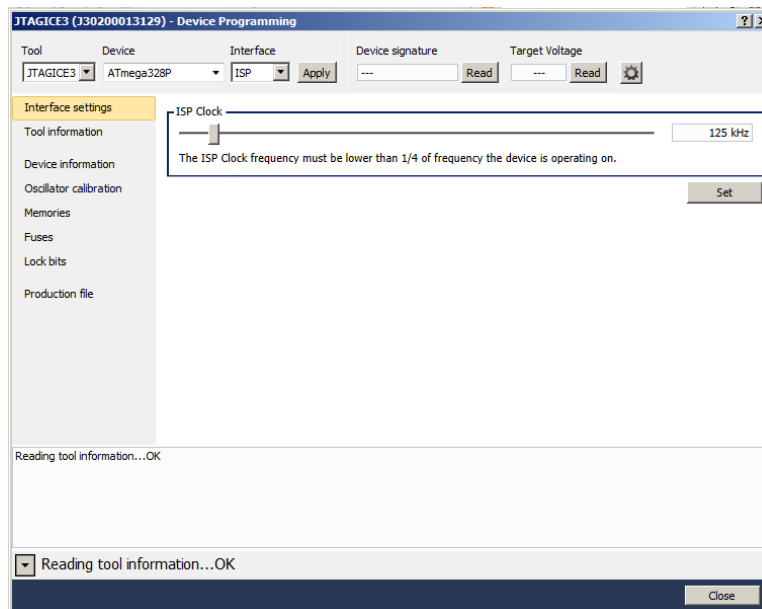

Configure:

Tool: JTAGICE3  
Device: ATmega328P  
Interface: ISP

select: Apply

If the pod is found, the following screen should show:

## Verify Pod connection to Atmega328p

Connect the Arduino Uno board to a USB cable.

Connect this USB cable to another windows PC for both power and serial I/O.

Connect the JTAGICE3 6pin ISP header to the UNO header: ICSP.

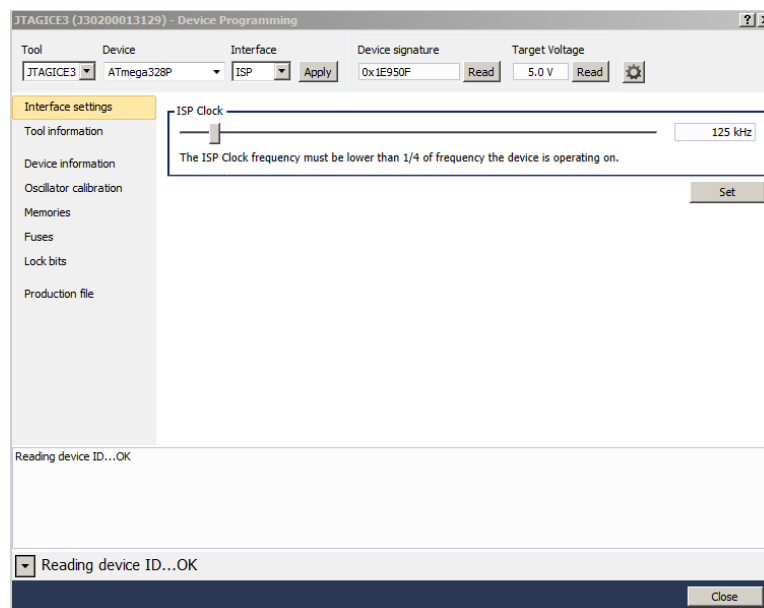

Select: Target Voltage → Read

It should return 3 to 5V.

Select: Device signature → Read

There should be no error messages of Device ID mismatch.

For the Atmega328P, the signature should be 0x1E950F.

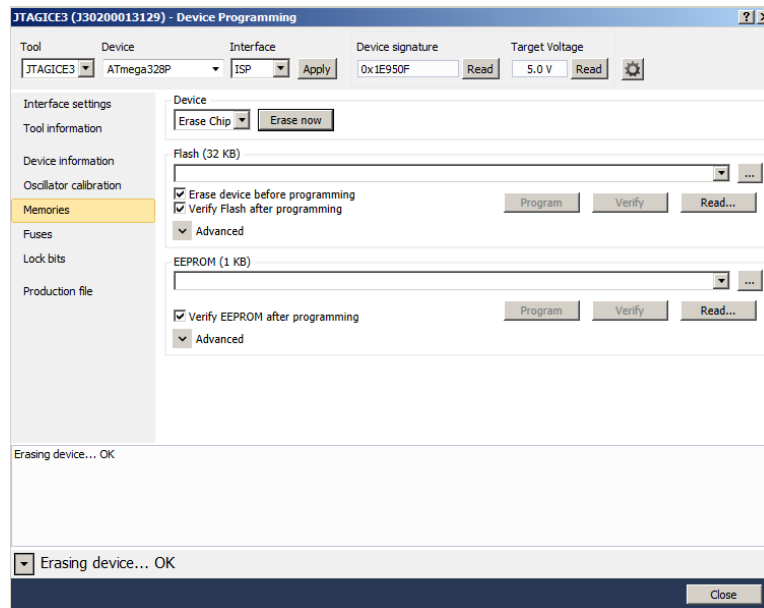

### 3.3. Programming Atmega328p

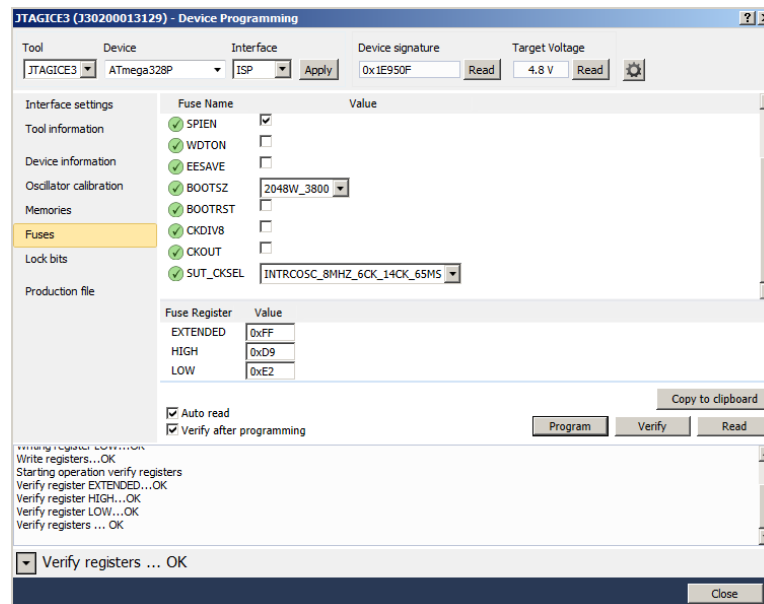

#### Erase Chip

Select: Memories → Device: Erase Chip → Erase Now

#### Fuses

Select: Fuses

<Corrected screenshot with LOW updated>

For Arduino Uno – ATmega328p:

EXTENDED: 0xFF

HIGH: 0xD9

LOW: 0xFF

### Load hello\_uno.hex

Select: Memories

Select: Flash: hello\_arduino\uno\hello\_uno.hex

Select: Program

### 3.4. Verify 1sec LED

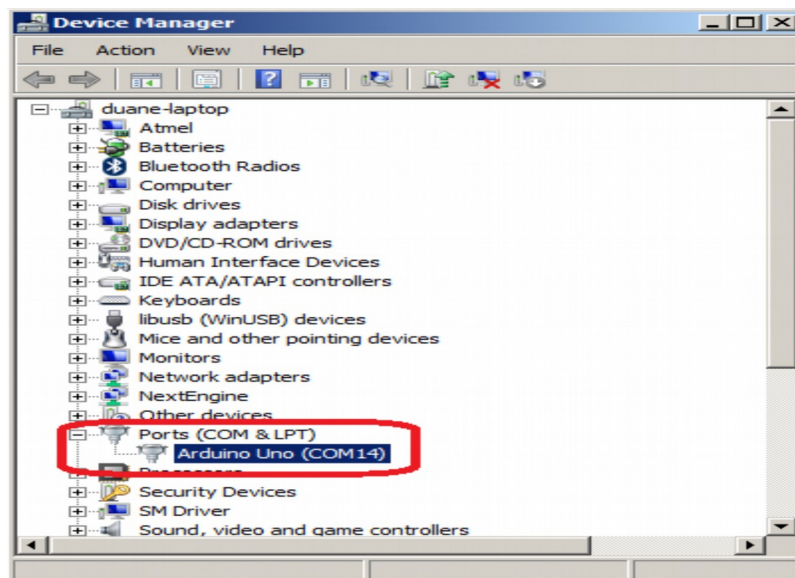

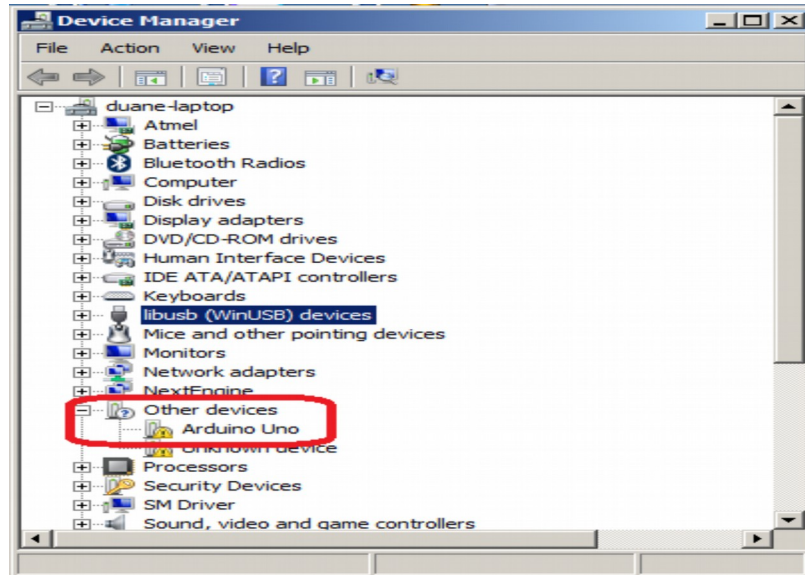

This should precisely transition once a second.

### 3.5. One-time Windows Driver Install

within windows, open the “Device Manager”

Select: Start, at the prompt enter: devmgmt.msc

Check whether there is a “Ports – COM port” defined,  
or an “Other devices/ Arduino Uno” showing?

The “Other devices/ Arduino Uno” means a driver needs to be installed:

Right Click “Other Devices / Arduino Uno”

Select Driver Update and point the update to the directory:

'hello\_arduino/Uno/doc' directory for the \*.inf file

References:

<https://www.arduino.cc/en/Main/USBSerial>

<https://www.arduino.cc/en/Guide/windows#toc4>

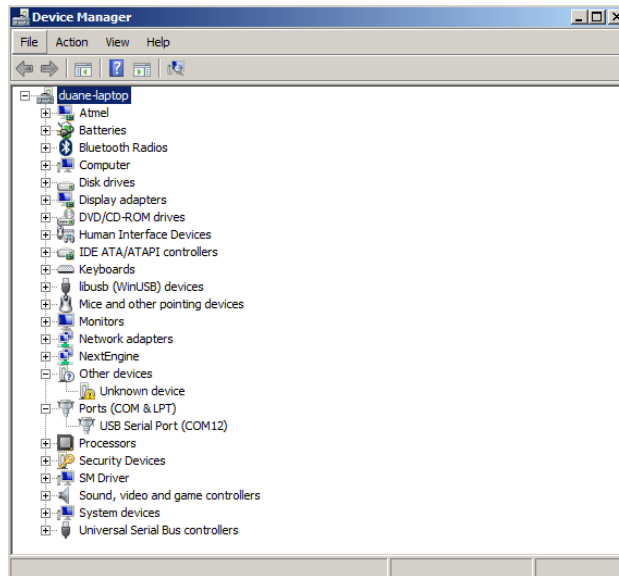

### 3.6. Verify Serial I/O

Open the windows "Device Manager"

Within windows: select Start, at the prompt enter: devmgmt.msc

Search for what COM ports are connected.

This example shows COM12 when the UNO is plugged in.

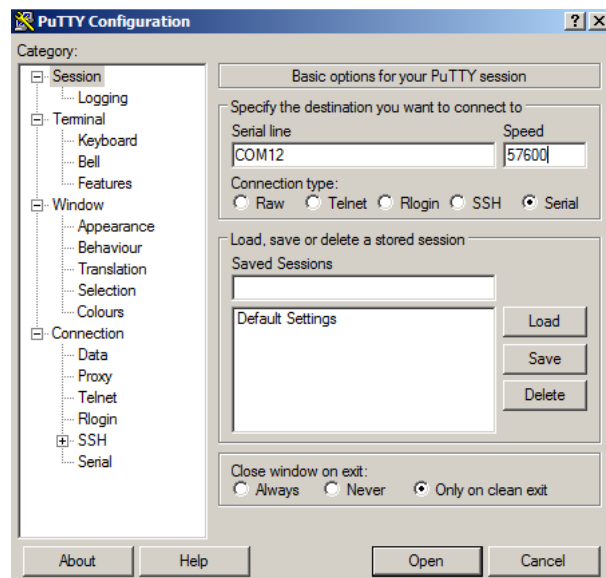

Start up a Putty window and configure:

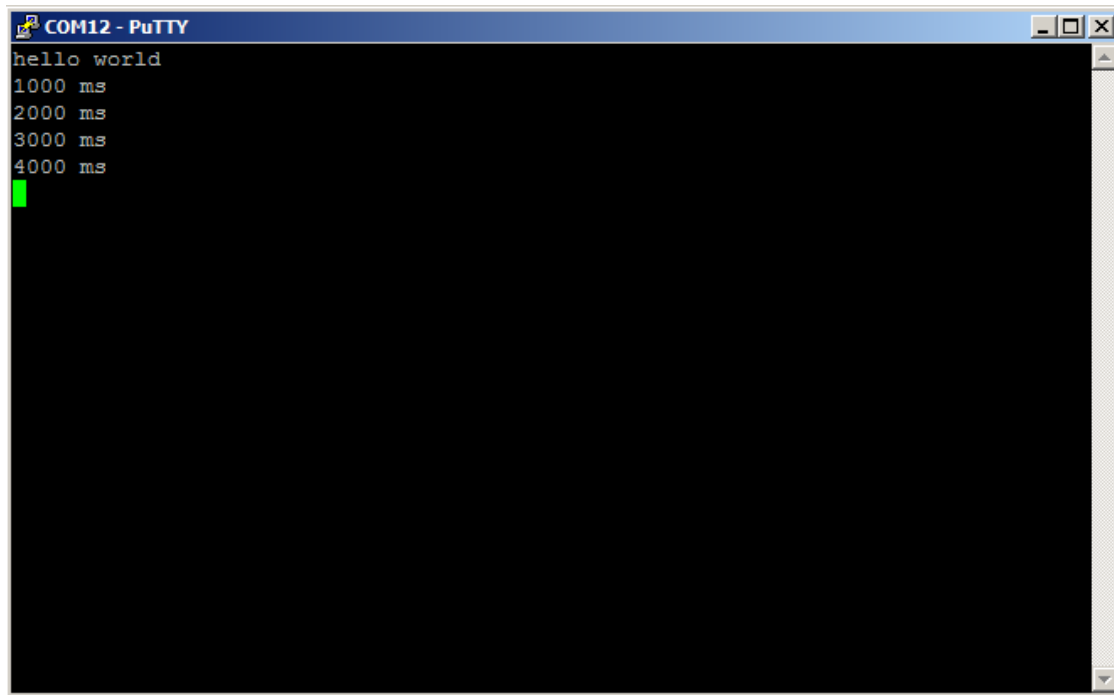

Connection type: serial

Serial line: COM12

Speed: 57600

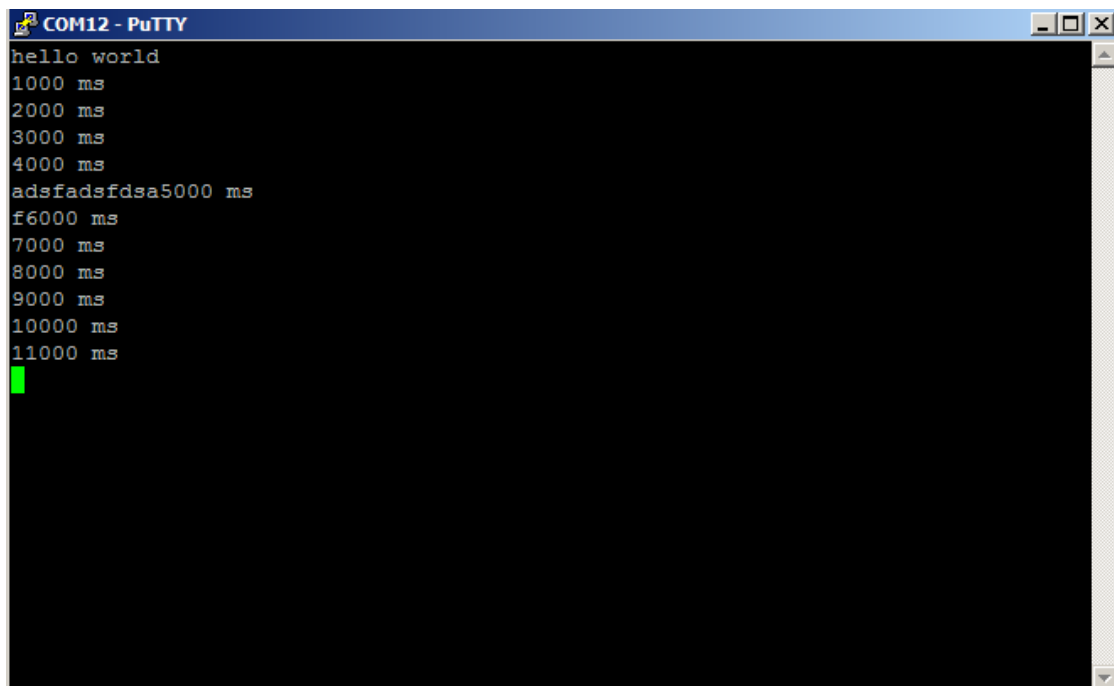

Select: Open

```
COM12 - PuTTY
hello world
1000 ms
2000 ms
3000 ms
4000 ms
█
```

Hit a few keys to verify the Arduino is receiving serial data:

```
COM12 - PuTTY
hello world
1000 ms
2000 ms
3000 ms
4000 ms
adsfadsfdsa5000 ms
f6000 ms
7000 ms
8000 ms
9000 ms
10000 ms
11000 ms
█
```

## 4. Design Notes - Fuses

### Atmega328P Fuse Notes:

```
Extended:      // 7 6 5 4 3 2 1 0
                // 1 1 1 1 1 1 1 1 => Atmel factory default: FF
                FD // 1 1 1 1 1 1 0 1 => Arduino UNO setting
                    +---+---+ BODLVL[2.0]: 111 - Disabled
                                    100 - 4.3V
                                    101 - 2.7V

High:          // 7 6 5 4 3 2 1 0
                // 1 1 0 1 1 0 0 1 => Atmel factory default
                D9 // 1 1 0 1 0 1 1 0 => Arduino UNO original setting: D6
                // 1 1 0 1 1 0 0 1
                // | | | | | | | + BOOTRST: 1 - no Boot Loader
                // | | | | | | +---+---+ BOOTSZ[1.0]: 00 - 2K words
                // | | | | | | +-----+ EESAVE: 1 - EEPROM not reserved
                // | | | | | | +-----+ WDTON: 1 - Watchdog timer off
                // | | | | | | +-----+ SPIE: 0 - SPI programming enabled
                // | | | | | | +-----+ DWEN: 1 - debugwire disabled
                // +-----+ RSTDISBL: 1 - External reset enabled

Low:           // 7 6 5 4 3 2 1 0
                // 0 1 1 0 0 0 1 0 => factory default: 62
                // 1 1 1 0 0 0 1 0 => internal 8Mhz RC: E2 → F_CPU = 8000000
                FF // 1 1 1 1 1 1 1 1 => 8-16Mhz ext crystal → F_CPU = xtal = 16000000
                // | | | | | | | + CLKSEL[3.0]: 0010 - internal 8Mhz
                // | | | | | | +---+---+ 111x - 8-16Mhz ext crystal
                // | | | | | | +-----+ 110x - 3-8Mhz ext crystal
                // | | | | | | +-----+ SUT[1.0],CLKSEL[0]: 11,1 - slowest start up
                // | | | | | | +-----+ CKOUT:1 - CLK not out on PB0
                // +-----+ CKDIV8: 1 - do not divide clk by 8

UNO : FD D9 FF
```
